ABOUT THE ORGANIZATION FOR SOCIAL RESEARCH AND ANALYSIS

The Organization for Social Research and Analysis (OSRA) is a nonpartisan and independent non-governmental organization based in Kabul. At OSRA, we conduct socio-economic research, public opinion polls, big data analytics, content analysis and a variety of data-driven research.

Our mission is to facilitate fact-based transparency to support sustainable development and good governance, and to promote democracy by producing evidence-based research and high-quality data analysis. We study Afghan public attitude, demographic trends, policy impact, communication and public relations with the help of the latest technology, as well as a standardized and customized methodology to enable intelligent decision-making processes. In order to deliver a meaningful message gleaned from complex and large datasets, we focus on presenting the general public and our clients with easy to read and comprehensible real-time data visualization platforms.

EXECUTIVE SUMMARY

The Afghan Presidential Election 2019 marked the fourth general election in Afghanistan since 2002. Data gathered from 11,337 adult participants covering 34 provinces during the run-up phase to the Afghan presidential elections on 28 September revealed that the willingness to participate in the presidential election was strikingly high despite the overall deteriorating security situation in Afghanistan. From 11,337 participants, 69.3% (7,860) stated they will participate in the election, 18.3% (2,079) stated they would not participate, and 12.3% (1,398) stated that they were undecided but intended to participate. While the willingness to participate remained the highest among Pashtun participants at 77.6%, more than half of Tajik participants at 62.7%, Hazara participants at 60.9%, and Uzbek participants at 64.4%, expressed their willingness to participate in the election.

The two mattered candidates remained Ashraf Ghani and Abdullah Abdullah. 40.9% of all participants willing to vote stated they would vote for Ashraf Ghani, and 7% of all the participants willing to vote stated they would vote for Abdullah Abdullah. Ashraf Ghani's voter-base was the highest in Kabul, Nangarhar, Kandahar, Herat and Helmand provinces, followed by almost the entire Pashtun belt provinces stretching from east to south to west Afghanistan. In contrast, Abdullah Abdullah's voter-base was the highest in Kabul, Herat, Takhar, Balkh and Faryab provinces, followed by the northern provinces spanning from the north-east to north-west of Afghanistan. Analysis of the data indicated that ethnic and geographic affiliation tends to determine the choice of the presidential candidate.

While 61.5% of all Pashtun participants said they would vote in favor of Ashraf Ghani, 1.9% said they would vote for Abdullah Abdullah. Tajik participants candidate preference was less stark with 23.2% in favor of Ashraf Ghani, and 12.3% in favor of Abdullah Abdullah. Hazara participants candidate preference tended to be rather even with 14.5% in favor of Ashraf Ghani, and 10.9% in favor of Abdullah Abdullah. Simultaneously, Uzbek participants were increasingly

in favor of Abdullah Abdullah with 19.9% as compared to Ashraf Ghani with 13.8%. The overall gender-based voting behavior revealed that Abdullah had a larger female voter base with 15.8% female, whereas the female voter base of Ashraf Ghani's was 6%. Meanwhile, of all female participants willing to vote, 32% remained undecided, 27.6% refused to name their choice of candidate, 23.9% said they would vote for Ashraf Ghani, and 10.8% preferred Abdullah Abdullah as their candidate of choice.

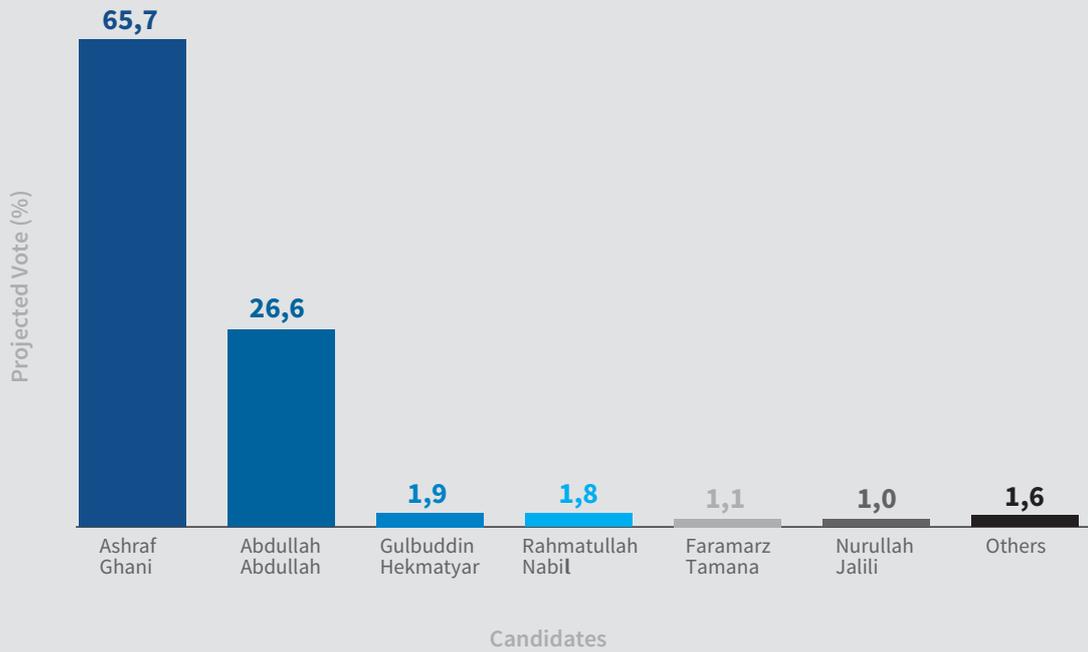

Male participants showed more certitude about their preference. Of all male participants willing to vote, 42.8% said they would vote for Ashraf Ghani, 27.9% refused to name their preferred candidate, 19% remained undecided, and 6.6% preferred Abdullah Abdullah.

The analysis of voter behavior from 5 August till 28 September revealed that both Ashraf Ghani and Abdullah Abdullah's popularity remained relatively constant. While Ashraf Ghani's voter base fluctuated between 34% - 45% with a decrease during the last weeks towards the election date, Abdullah Abdullah's voter base varied between 4% - 10% with an increase during the last weeks up to the elections.

A post-election poll was conducted between 1st and 20th October 2019, with a total of 4,424 adult participants. Of all the 4,424 participants 48.7% (2158) stated that they had cast their vote. The willingness to participate in the presidential election during the pre-election phase was much higher at 69.3% than the actual post-election phase revealed. However, analysis of the collected data from pre and post-election polls demonstrates that Ashraf Ghani remained the frontrunner in both the pre-election and post-election polls, followed by Abdullah Abdullah and Gulbuddin Hekmatyar. The main voter bases were concentrated in the provinces of Kabul, Herat, Nangarhar, Kandahar and Balkh provinces, mirroring the major population centers of the country.

PRE-ELECTION OPINION POLL

01

INTRODUCTION

INTRODUCTION

The objective of this poll was to understand public opinion towards the Afghan presidential election 2019, to study people's preferences towards the presidential candidates, and to reflect their opinion in real-time on a web platform.

The poll was conducted for eight weeks from the 5 August to 28 September 2019 and a total of 11,337 adult participants were polled from all 34 provinces of Afghanistan. A random and representative sample of men and women aged 18 and above were polled via phone interviews.

OSRA chose phone interviews as this still remains the most reliable and tested method in building a random and representative sample.¹ Especially in the culturally and highly sensitized context of Afghanistan, empirical experience showed, phone interviews provide interviewees the time and space to respond to critical and sen-

sitive questions without social and peer pressure of family members or bystanders. Furthermore, women willing to respond demonstrate greater enthusiasm and openness towards phone interviews.

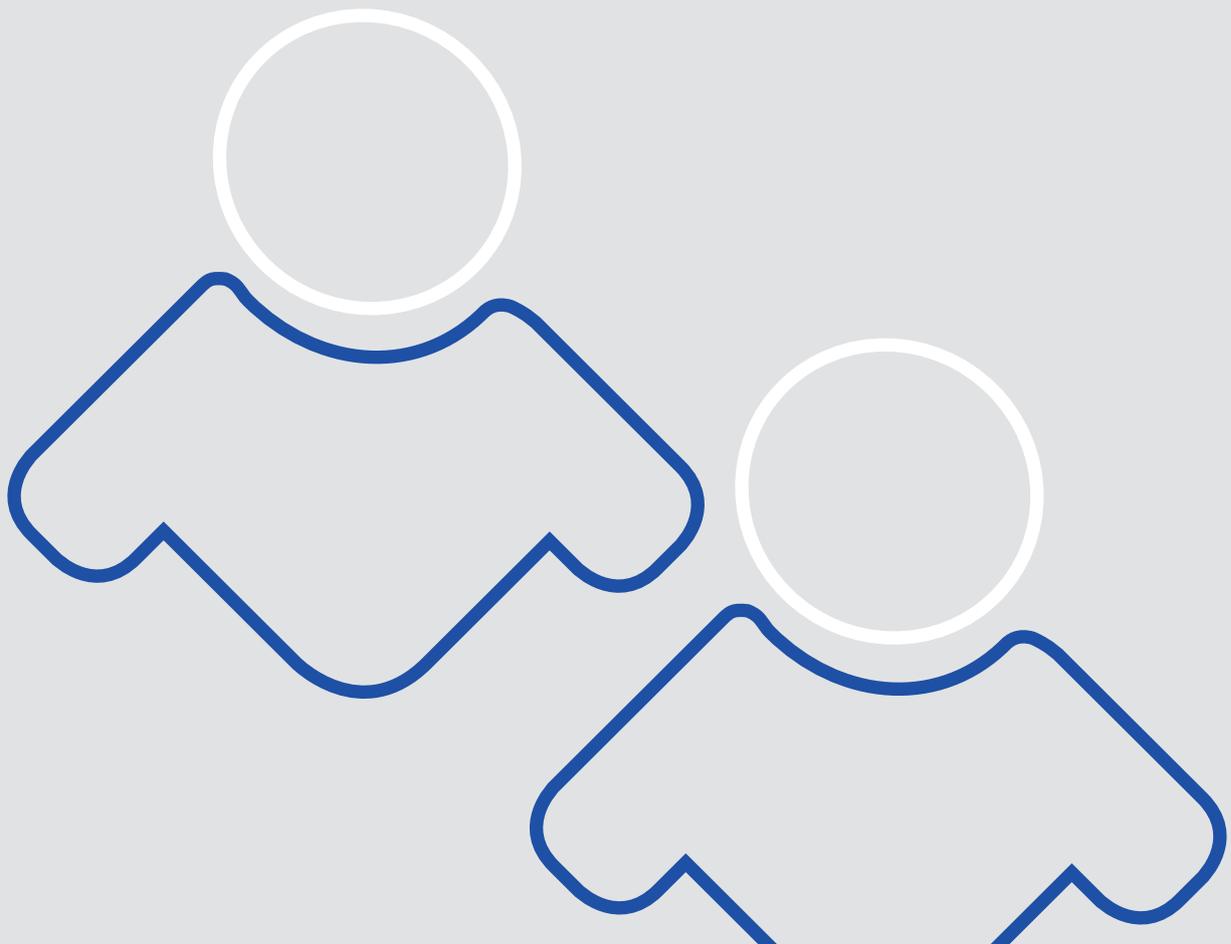

To analyze and reflect public opinion in real-time, the Organization for Social Research and Analysis (OSRA) utilized a web-based real-time opinion poll analysis and data visualization system, the Real-Time Opinion Polling Platform (ROPP), developed especially for this poll.

As allegations of vote-rigging and ballot box tampering have been widespread in previous Afghan elections, contributing to distrust and disillusionment with politics and politicians by voters, the purpose of this poll was to increase transparency by creating predictability mechanisms based on scientific research.

02

METHODOLOGY

METHODOLOGY

DATA COLLECTION

OSRA polled 11,337 adult participants from all 34 provinces in Afghanistan. To achieve an unbiased and representative sample, the random digit dialing sampling methodology was applied. The poll interviewed a random and representative sample of men and women aged 18 and over by phone. A specially designed Survey Management System (SuMSy) was used for the data collection process. SuMSy facilitates and speeds up the data gathering process and ensures the consistency and validity of the data during the entry. It is designed to assist data gathering in telephone surveying and allows the interviewer to follow a script provided by the software to ensure accurate and valid data entry.

Random telephone numbers were generated using SuMSy's intelligent 'valid phone number generator' module. To ensure inclusive and non-discriminatory coverage, numbers from all Afghan telecommunication providers (including but not limited to Roshan, Etisalat, Afghan Wireless, MTN, and Salaam) were used. The data gathering was conducted by experienced operators who contacted participants in order to capture their views. The operators were fluent in all the official languages of Afghanistan including Dari, Pashto, Uzbeki, and Turkmani. Female operators were specifically trained to ease the interview process for female participants, who tendentially feel more comfortable and willing to talk to women.

After gaining the consent of each participant, the interviews were recorded and digitally stored in SuMSy. The interview questions are provided in Annex I.

DATA QUALITY

To ensure consistency and validity of the data, OSRA adopted a two-layer quality assurance procedure. First, SuMSy has an integrated data validity and consistency check which prevents the entry of invalid and inconsistent data. Second, after the data is entered into the system by the interviewers, it is checked by the data quality control team. They listen to the voice recording and make sure that the entered data is consistent with the recording. After passing these two stages, the data is released to be published on the ROPP.

MARGIN OF ERROR

The margin of error in this poll is +/- 1 % resulting from an estimated proportion of $p=0.5$ and a confidence interval of 95%.

DATA PRESENTATION

For the purpose of this poll, ROPP - a Real-time Data Visualization System - was developed and tailored to the context and requirements of this poll. ROPP is a web-based real-time opinion polling, data analysis, and data visualization platform. It offers a very user-friendly and intuitive data analysis and visualization functionality. The user can see the data in different categories and filter it according to demographic attributes; enabling users to infer varying correlations with the help of multiple concurrent filters. This provides and allows for a wide range of hypotheses to be drawn, and possible conclusions to be made.

03

DEMOGRAPHICS

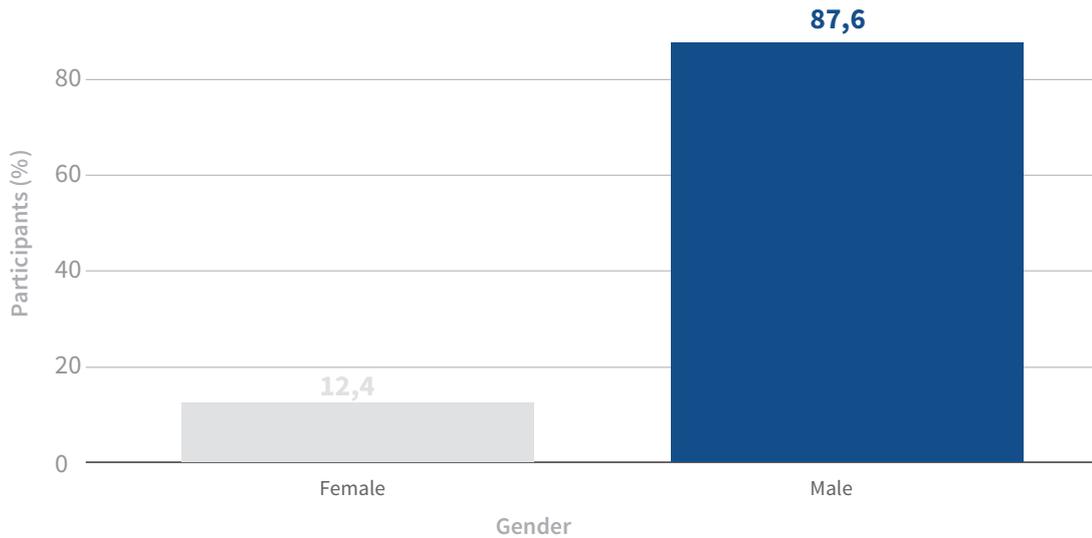

DEMOGRAPHICS

GENDER DISTRIBUTION

The male/female ratio of the collected sample was 87.6% male and 12.4% female.²

Gender Distribution

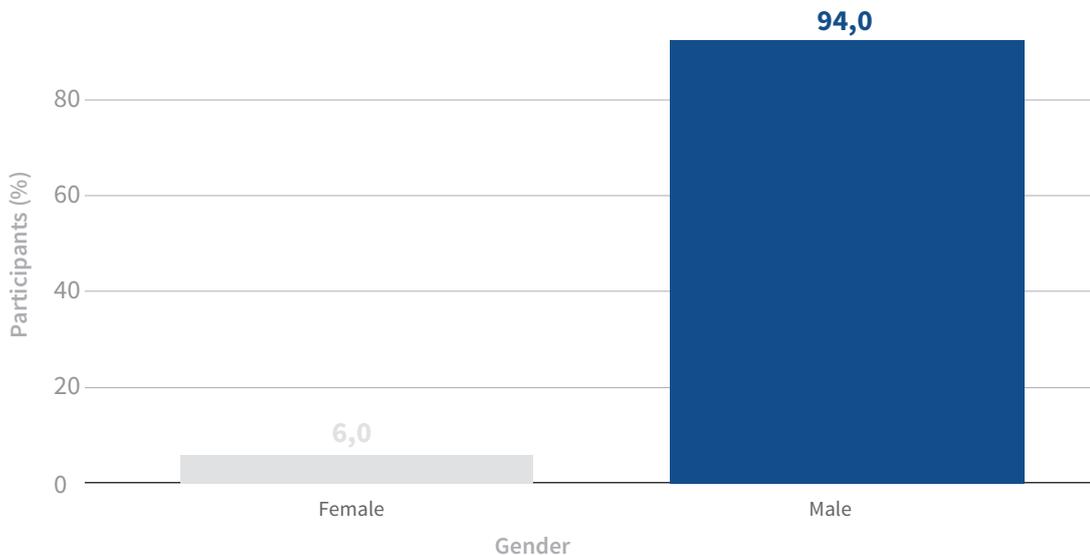

Fig. 3: Male/Female ratio of all participants (%)

Of all the participants that said they would vote for Ashraf Ghani, 94% were male and 6% were female.

Gender Distribution

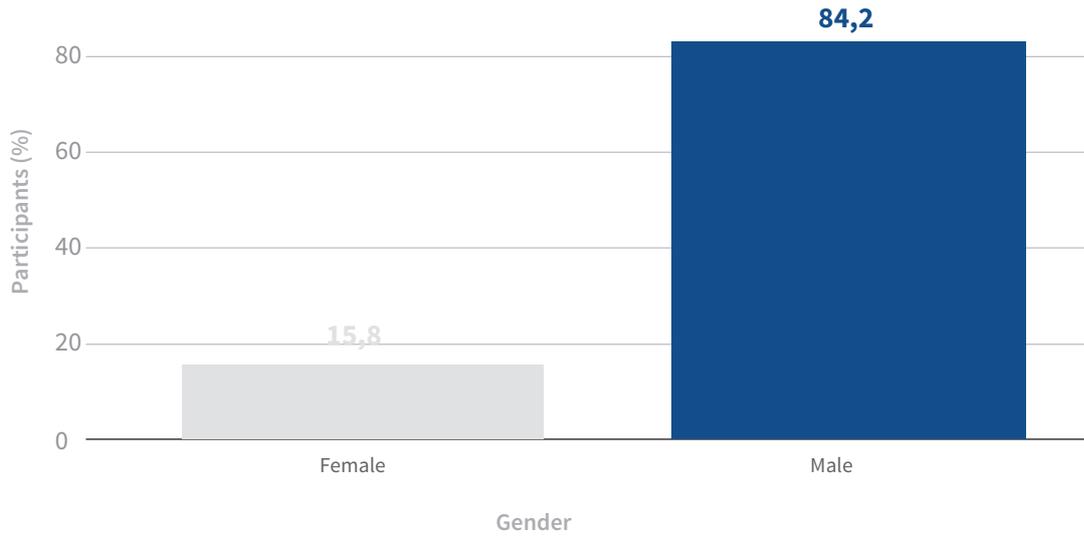

Fig. 4: Male/Female ratio of participants in favour of Ashraf Ghani (%)

2. The reason for this disproportion is twofold: firstly, households that can afford only one mobile phone, it is more likely that the male head of the household will have primary access to that mobile phone, therefore, making it less likely for women in the household to be sampled. Secondly, women are less likely to answer the phone if the caller is unknown to them. Hence, they are less likely to be sampled.

GENDER DISTRIBUTION

Fig. 5: Male/Female ratio of participants in favor of Abdullah Abdullah (%)

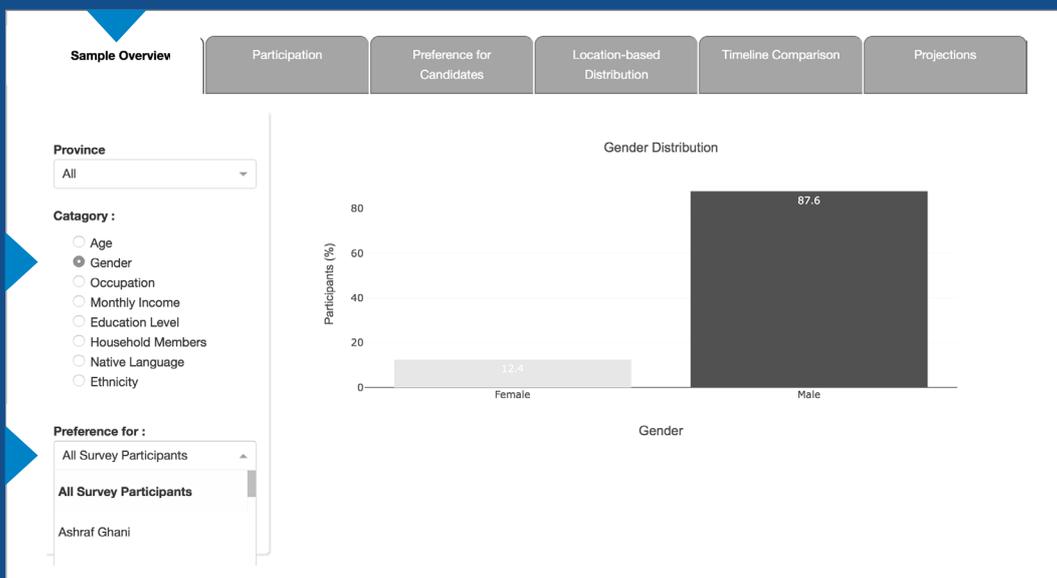

Of all the participants that said they would vote for Abdullah Abdullah, 84.2% were male and 15.8% were female.

For additional queries into the male/female ratio of participants for other candidates, visit the link:

→ <https://ropp.osra.af>

click the tab “Sample Overview”, choose the category labeled “Gender”, and from the drop-down menu “Preference for:” select a candidate.

Fig. 6: Sample Overview, filter: Gender

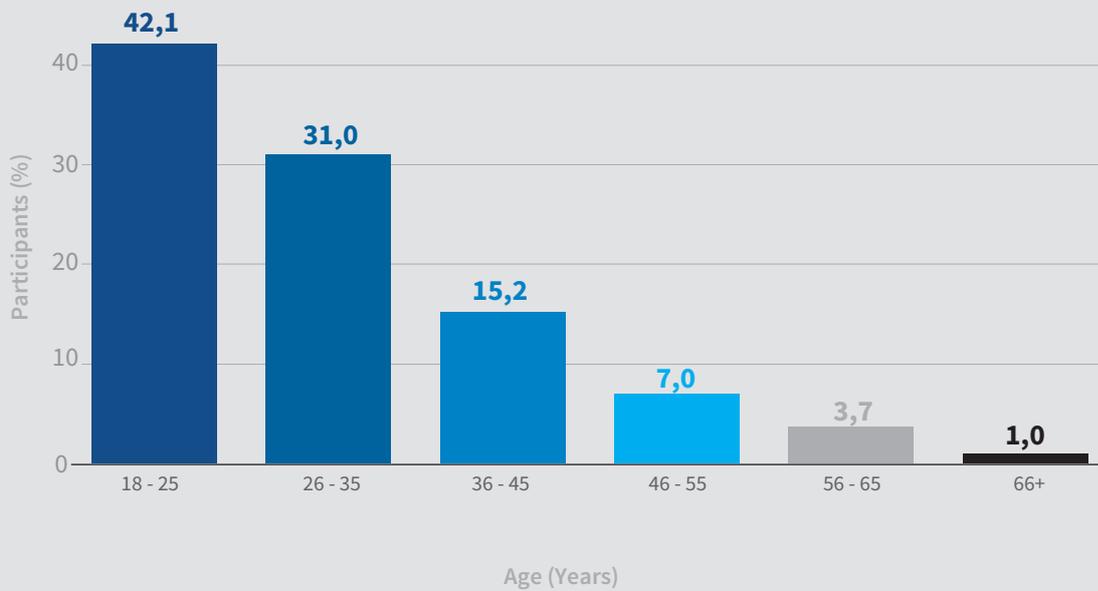

AGE DISTRIBUTION

The age distribution shows that 73.1% of the 11,337 participants polled were aged 35 years or younger.

AGE DISTRIBUTION

Fig. 7: Age distribution of all participants (%)

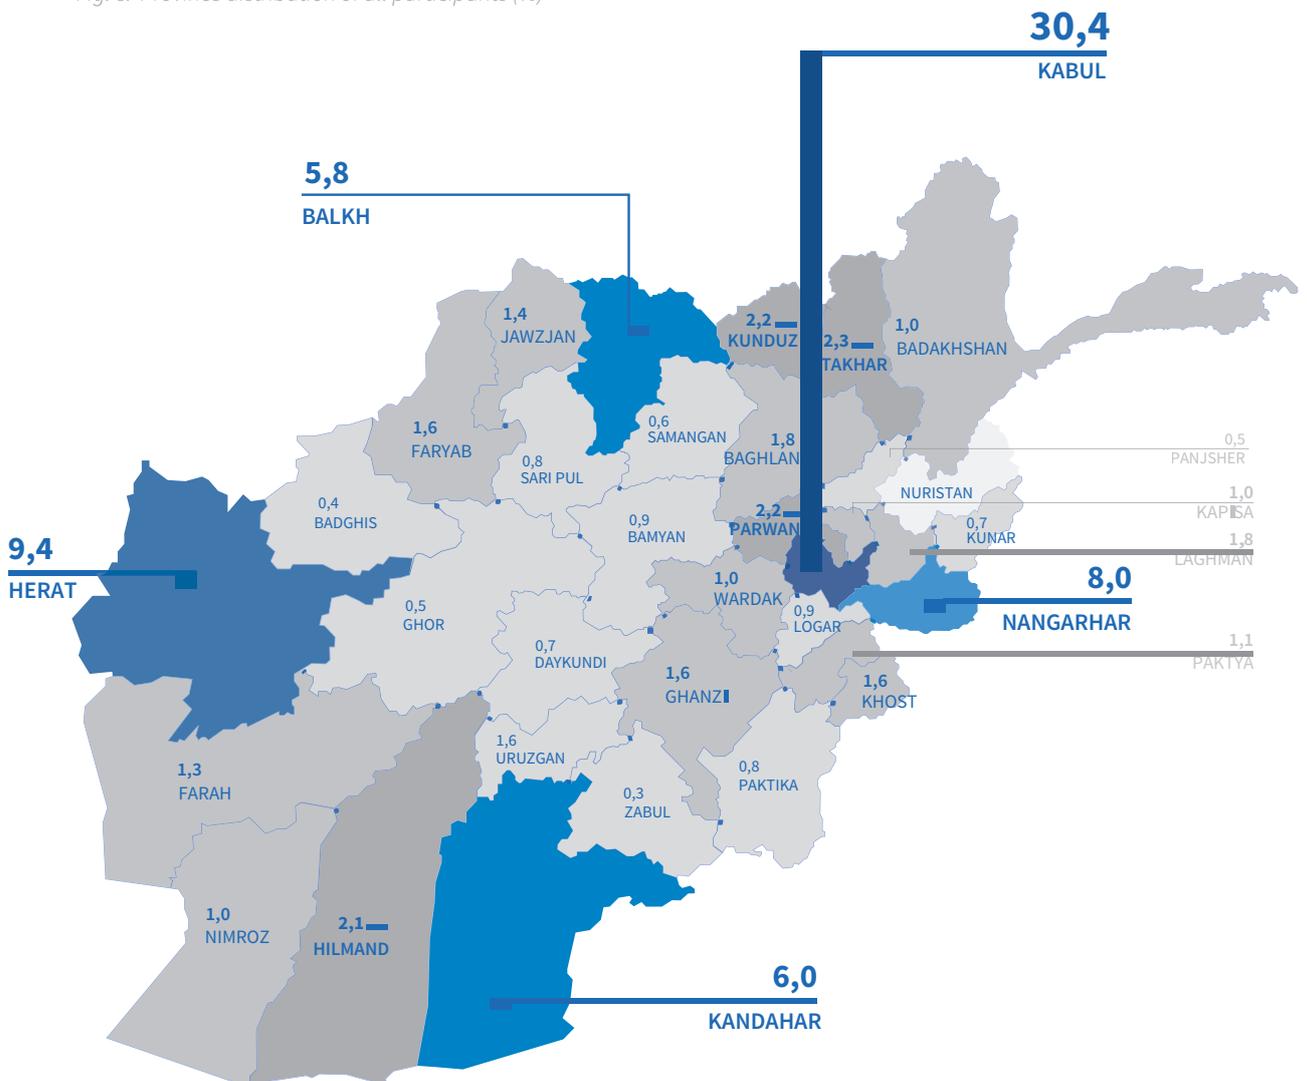

GEOGRAPHICAL DISTRIBUTION

The poll covered all 34 provinces of Afghanistan. The sample size distribution largely mirrors the population distribution of the country. The higher number of participants from Kabul, Herat, Nangarhar, Kandahar and Balkh provinces is indicative of the concentrated population in these provinces; specifically, the major cities of Kabul, Herat,

Jalalabad, Kandahar, and Mazar-e-Sharif. High population density and better mobile connectivity makes it more likely for people living in these areas to be approached.

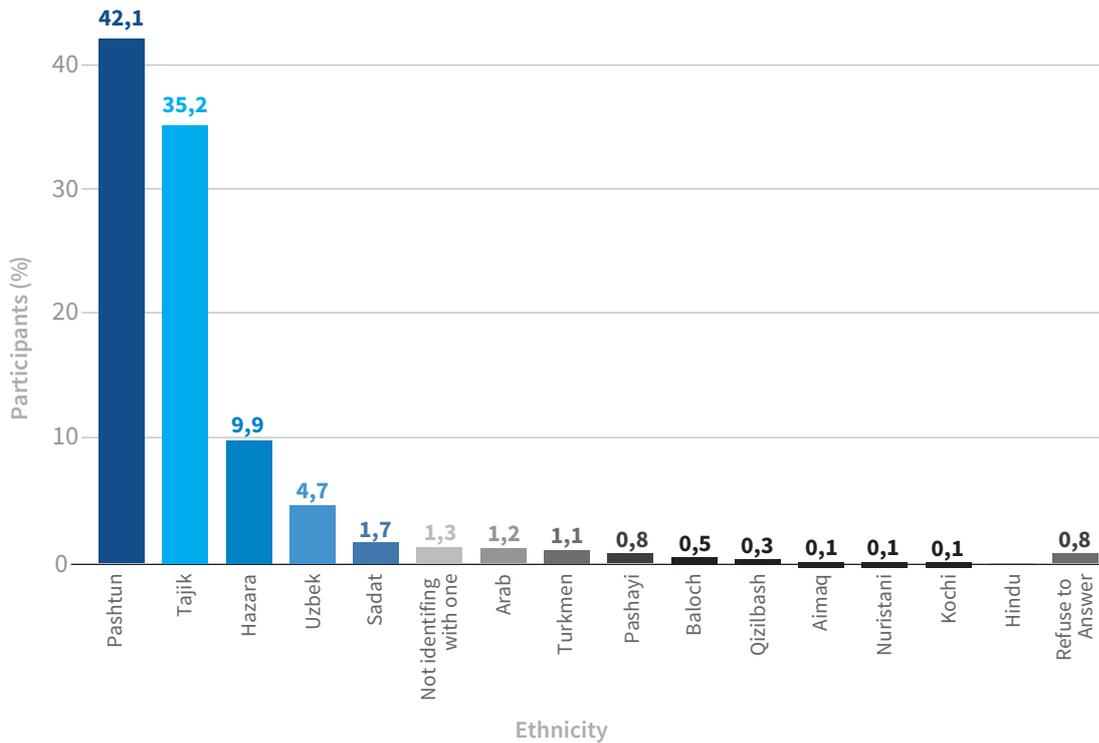

LOCATION-BASED DISTRIBUTION

Fig. 8: Province distribution of all participants (%)

ETHNICITY DISTRIBUTION

Fig. 9: Ethnicity distribution of all participants (%)

ETHNIC DISTRIBUTION

The ethnic distribution shows that Pashtun and Tajik ethnic groups account for 77.3% of the representative sample of 11,337.

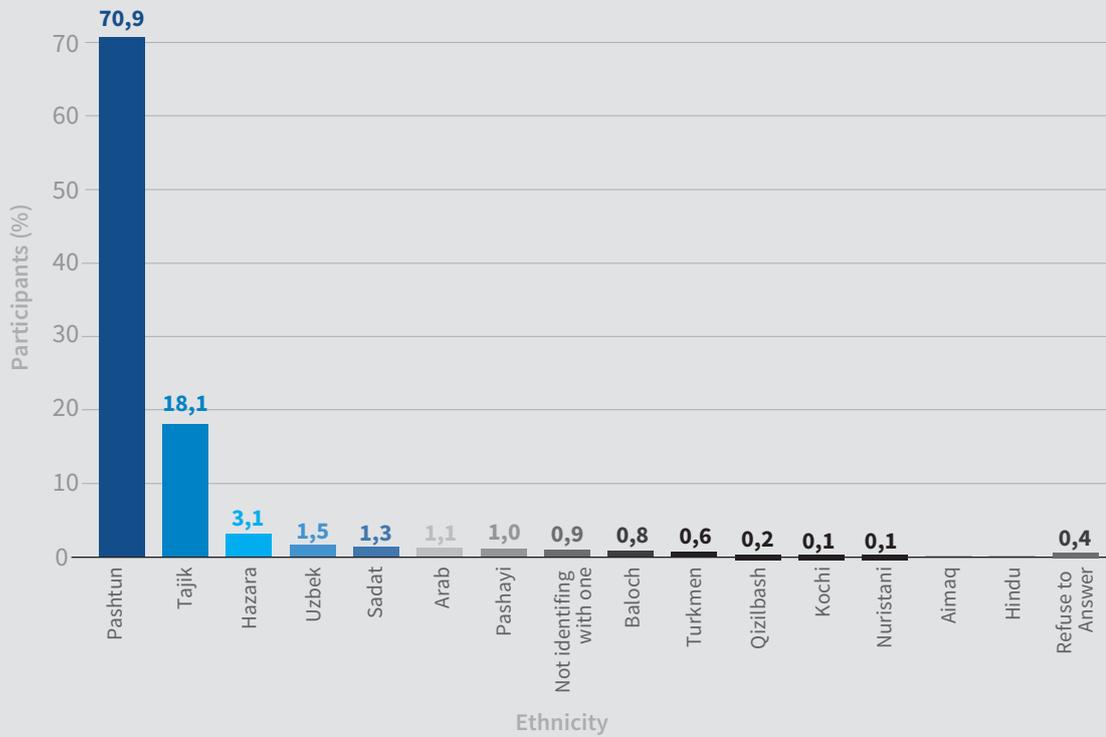

Of all the participants that said they would vote for Abdullah Abdullah, 55.6% were Tajiks, 13.5% were Hazaras, 12.8% were Pashtuns and 12.4% were Uzbeks.

Of all the participants that said they would vote for Ashraf Ghani, 70.9% were Pashtuns, 18.1% were Tajiks, 3.1% were Hazaras and 1.5% were Uzbeks.

ECONOMIC BACKGROUND

The monthly income of all participants in Afs was divided into six categories. The majority of participants had a monthly income between 0 - 30,000 Afs, however, a significant 31.9% refused to answer the question.

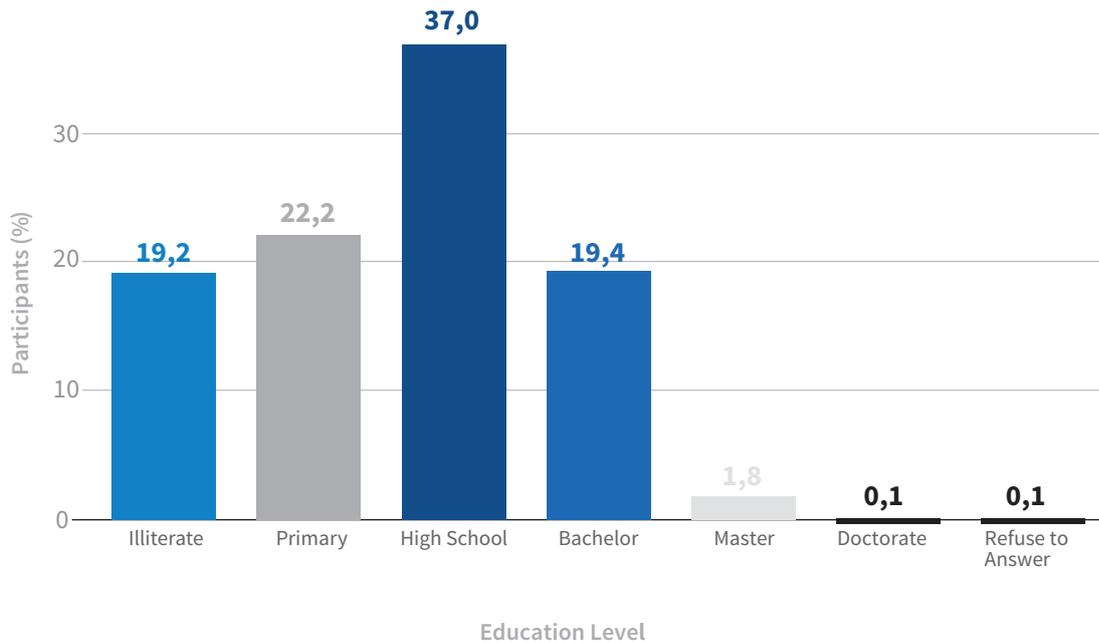

MONTHLY INCOME DISTRIBUTION

Fig. 13: Income distribution of all participants (%)

EDUCATIONAL LEVEL DISTRIBUTION

Fig. 14: Education level distribution of all participants (%)

EDUCATIONAL BACKGROUND

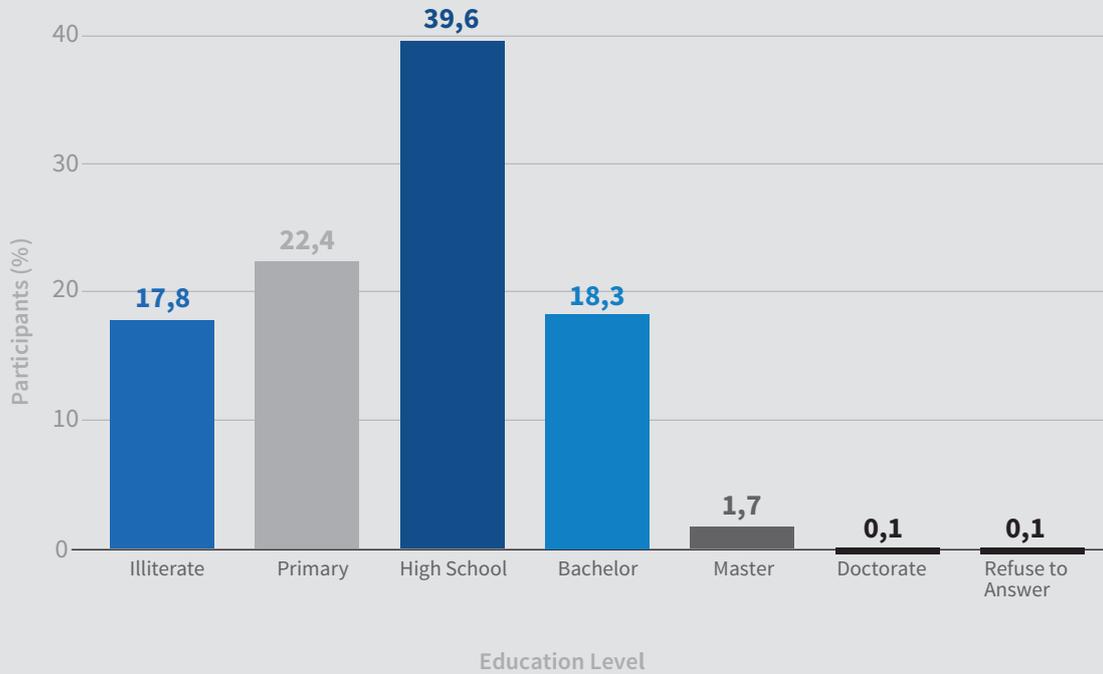

Of all 11,337 participants, 37% had high school degrees, 22.2% had received only primary education, 19.4% had a bachelor’s degree, and 19.2% were illiterate. A total of 21.3% of the entire sample size were holders of an academic degree.

All participants that said they would vote for Abdullah Abdullah, 39.6% had a high school degree, 23.7% had received primary education, 15.7% had a bachelor’s degree, and 19.9% were illiterate.

Of all participants that said they would vote for Ashraf Ghani, 39.6% had a high school degree, 22.4% had received primary education, 18.3% had a bachelor’s degree, and 17.8% were illiterate.

PARTICIPATION

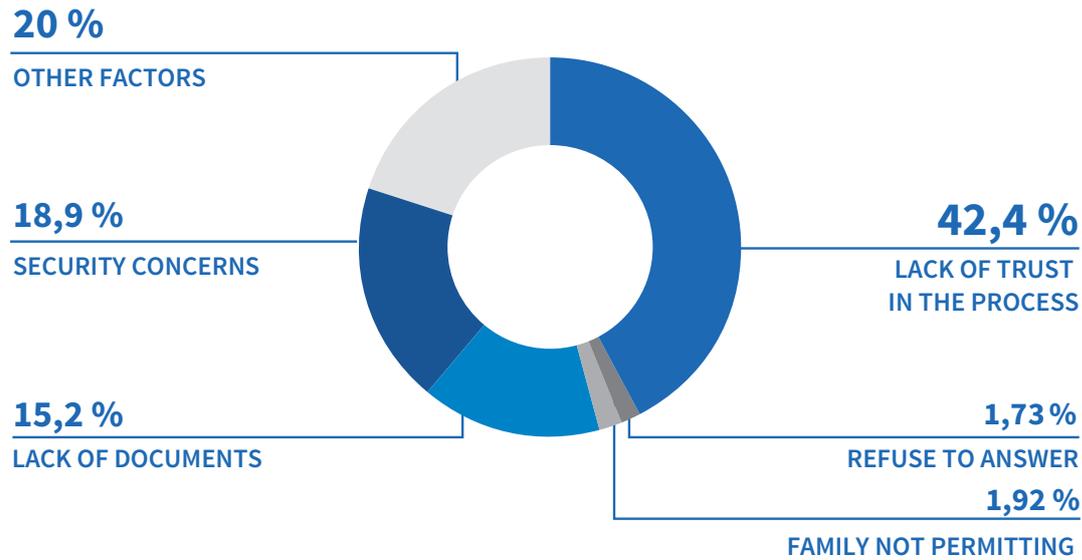

WILL YOU PARTICIPATE IN THE UPCOMING ELECTION ?

Fig. 18: Willingness to participate in all participants (%)

IF NOT PARTICIPATING, WHAT IS YOUR REASON ?

Fig. 19: Reasons for not participating in all participants (%)

PARTICIPATION

The poll reflected willingness to participate and to not participate along the lines of ethnicity, location, age, gender, occupation, native language, education level, monthly income, and household members. The results illustrate that 69.3% of 11,337 respondents would participate in the Afghan presidential election of 2019. 18.3% of the respondents

said they would not participate and only 12.3% were undecided in the pre-election opinion poll up to 28 September 2019. Of the 18.3% that would not participate, 42.4% stated “lack of trust in the election process”, 20% chose “other factors”, 18.9% said “security-related reasons”, followed by “lack of documents” at 15.2% as their reason not to participate.

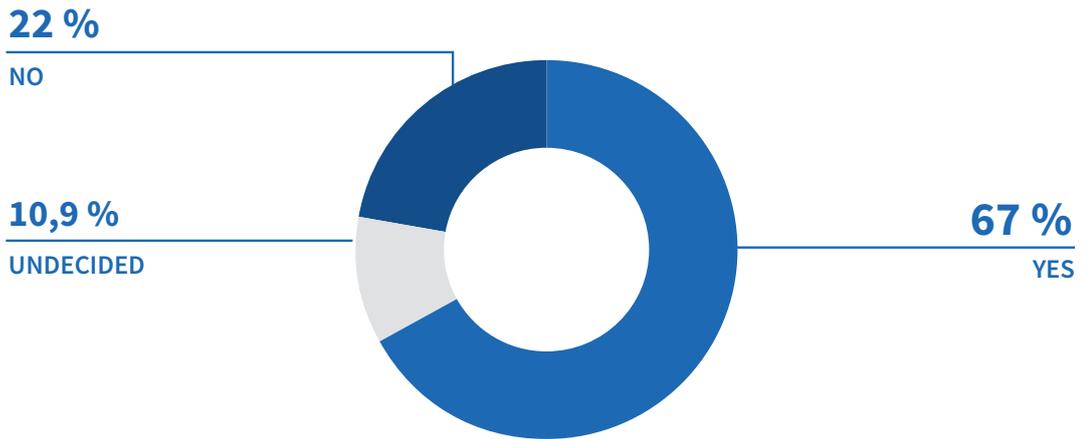

PARTICIPATION AND PROVINCE

The willingness to participate of all respondents from Kabul province was 67%, followed by 22% that said they would not participate - a further 10.9% were undecided.

WILL YOU PARTICIPATE IN THE UPCOMING ELECTION ?

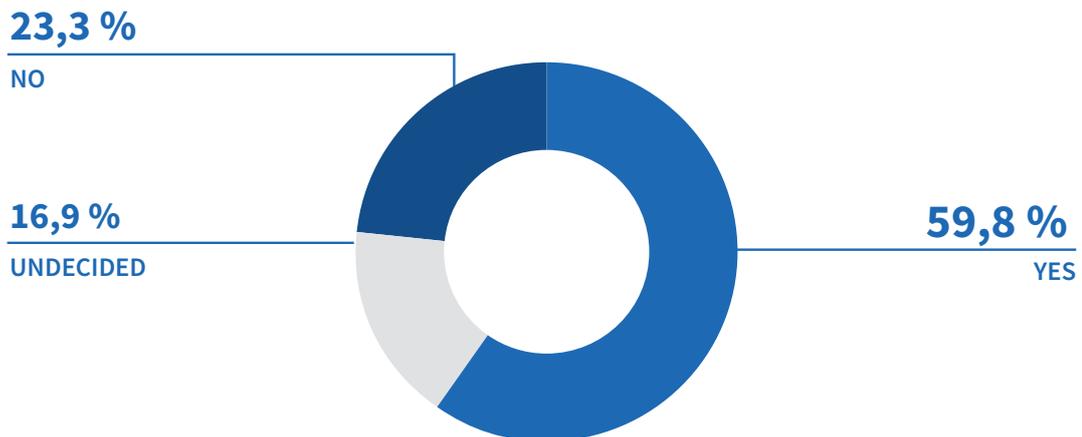

Fig. 20: Willingness to participate across all participants from Kabul province (%)

The willingness to participate of all respondents from Herat province was 59.8%, followed by 23.3% that said they would not participate - a further 16.9% were undecided.

WILL YOU PARTICIPATE IN THE UPCOMING ELECTION ?

Fig. 21: Willingness to participate in all participants from Herat province (%)

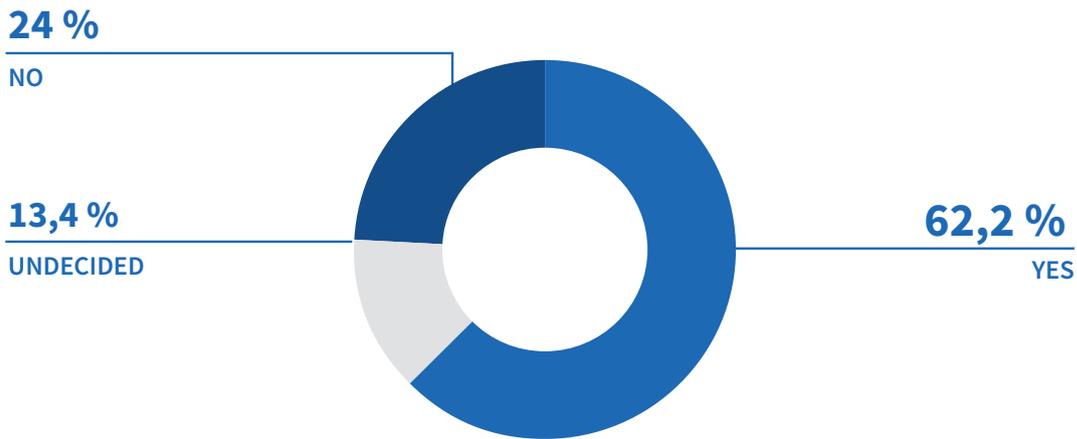

PRE-ELECTION OPINION POLL

The willingness to participate of all respondents from Balkh province was 62.6%, followed by 24% that said they would not participate - a further 13.4% were undecided.

WILL YOU PARTICIPATE IN THE UPCOMING ELECTION ?

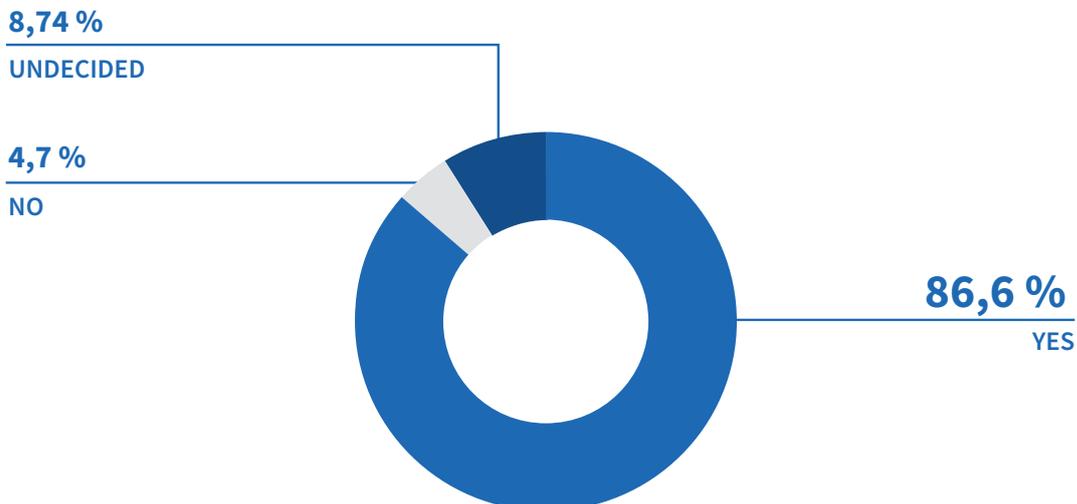

Fig. 22: Willingness to participate in all participants from Balkh (%)

The willingness to participate of all respondents from Nangarhar province was 86.6%, followed by 4.7% that said they would not participate - a further 8.74% were undecided.

WILL YOU PARTICIPATE IN THE UPCOMING ELECTION ?

Fig. 23: Willingness to participate in all participants from Nangarhar (%)

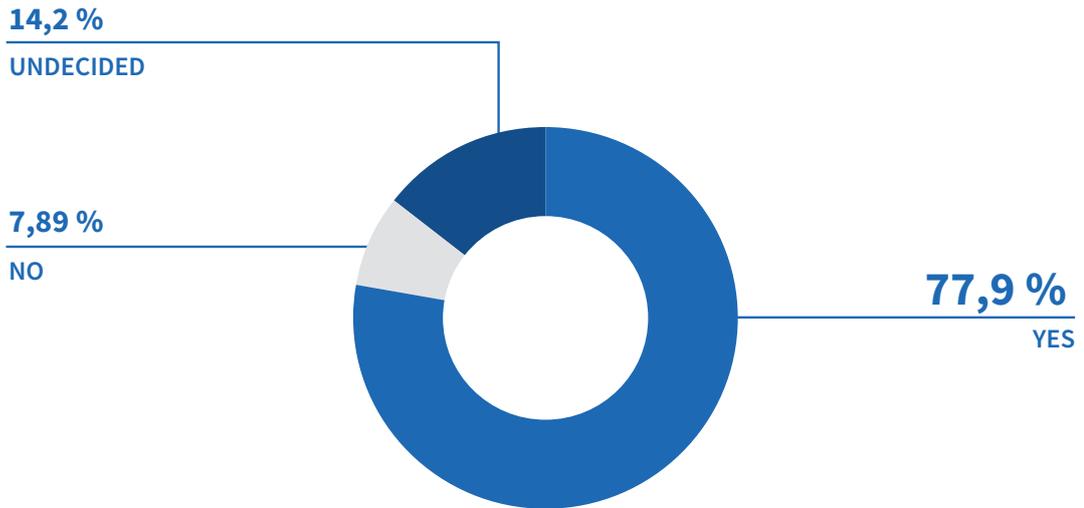

PRE-ELECTION OPINION POLL

The willingness to participate of all respondents from Kandahar province was 77.9%, followed by 7.89% that said they would not participate, - a further 14.2% were undecided.

WILL YOU PARTICIPATE IN THE UPCOMING ELECTION ?

CANDIDATE PREFERENCE

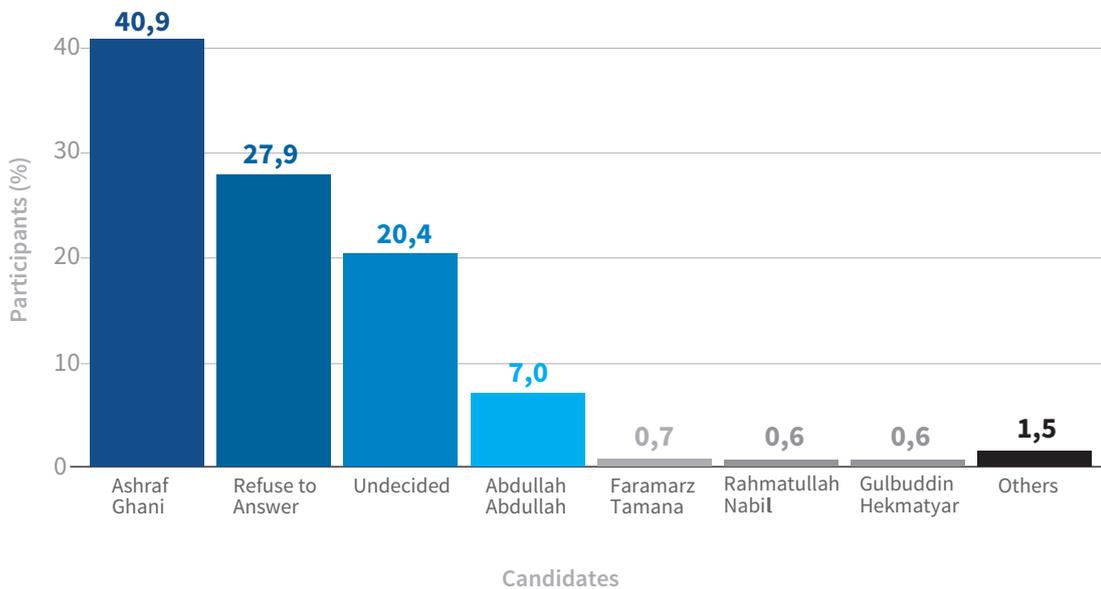

CANDIDATE PREFERENCE

Of the 11,337 people polled, 69.3% (7,860) said they would vote for one of the candidates. The male/female ratio was 90:10, which resulted in a disproportionate low representation of possible female voters.³ While the collected data was broken down and analyzed by province, age, gender, occupation, ethnicity, level of education, monthly income, mother language, and household members, the aim was to identify trends in relation to the candidates.

All participants polled over the course of eight weeks, from 5 August to 28 September 2019, indicated that if the election was held tomorrow, 40.9% would vote for Ashraf Ghani, 27.9% indicated that they would vote but refused to answer the question, while 20.4% would vote but remained undecided whom to vote for. Further 7% would vote for Abdullah Abdullah, 0.7% for Faramarz Tamana, 0.6% for Rahmatullah Nabil, and 0.6% for Gulbuddin Hekmatyar.

IF THE ELECTION WAS TOMORROW, WHICH CANDIDATE WILL YOU VOTE FOR (IN %) ?

Fig. 49: Candidate preference of all participants (%)

³ There are many potential reasons for the skewness of this data and the lack of female participants. If a household can afford only one mobile phone, it is more likely that the male head of the household will have primary access to that mobile phone and therefore be more likely to be sampled. Furthermore, women are less likely to answer the phone if the caller is unknown. Hence, they are less likely to be sampled.

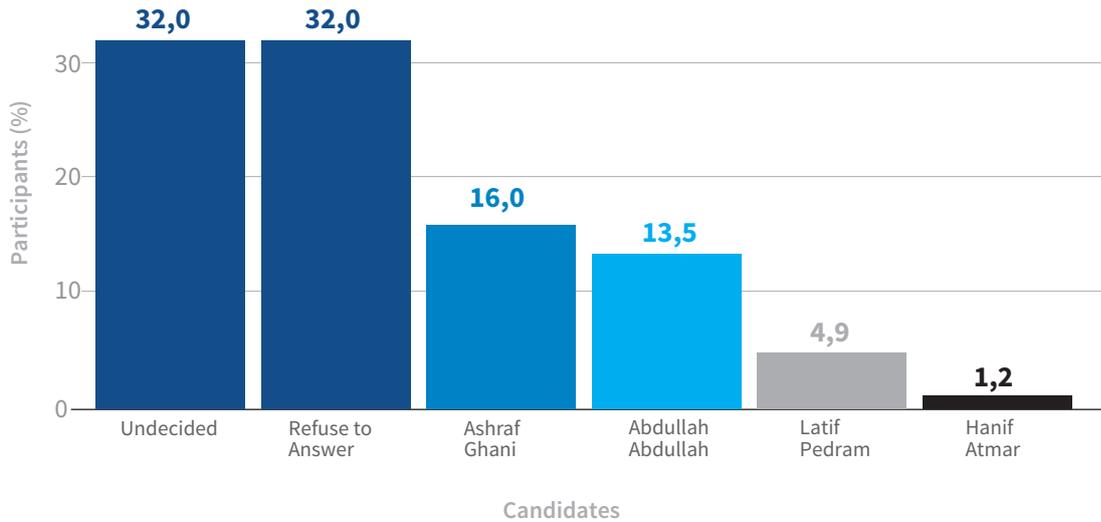

CANDIDATE PREFERENCE AND PROVINCE

In Badakhshan province 64% of the sample size polled remained largely undecided or refused to answer. While 16% would vote in favour of Ashraf Ghani, 13.5% would vote for Abdullah Abdullah if the election was held tomorrow.

CANDIDATES SUPPORT BASE TIMELINE

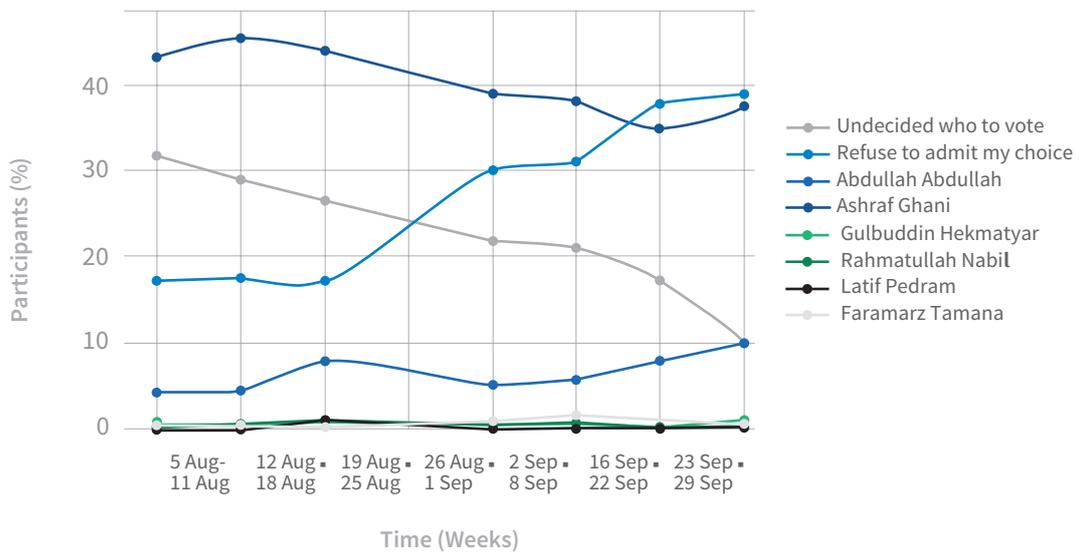

CANDIDATES SUPPORT BASE TIMELINE

The below graph compares each presidential candidate's support base over a course of eight weeks, from 5 August till 28 September 2019. The collected data shows a rather consistent support base for all candidates. While Ashraf Ghani's support base decreased from 43% in the first week to 38% by week eight, Abdullah Abdullah's support base increased from

4% in the first week to 10% by week eight. The trend further shows that over the course of eight weeks, the number of undecided participants declined drastically from 32% to 10% while, simultaneously, the number of participants who refused to share their choice of candidate increased from 17% to 39%.

TIMELINE COMPARISON

07

PROJECTIONS

PROJECTIONS

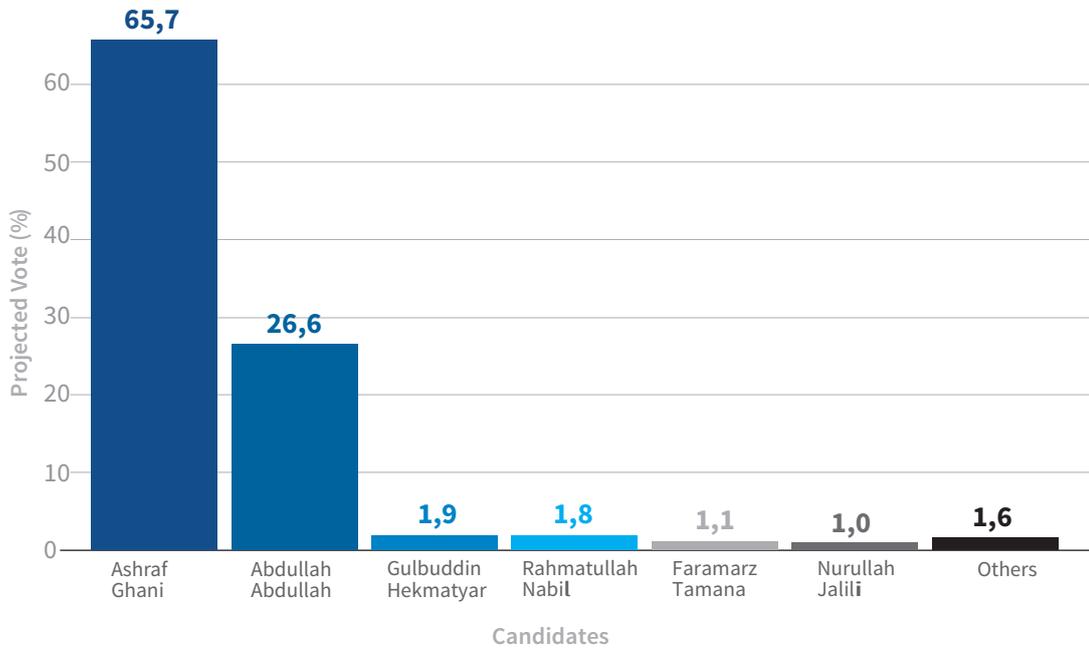

Projection is the process of resolving the ‘Undecided’ and the ‘Refuse to Answer’ responses. These responses are projected over the candidate’s voter bases. For the current projection, ‘ethnicity-based preference’ is used as the basis for calculating the proportionality ratio. The ‘Undecided’ and the ‘Refuse to Answer’ within each ethnicity is divided in proportion to their respective candidates’ preference. Then, each candidates’ different ethnic numbers are added together to get the most probable final

projected result for that specific candidate.

Figure 74 displays a probable projected vote for each of the candidates. The projection is specified by the “Time Period Filter”, i.e. the number of participants polled within that time interval. In figure 74 the time interval is set from 19 to 28 September 2019. The default projection is based on the last 10 days up to the election—as these days tend to be more representative of what the election results could be.

**POST-ELECTION
POLL OF THE
AFGHAN PRESIDENTIAL
ELECTION 2019**

01

INTRODUCTION

INTRODUCTION

A post-election poll was conducted in order to estimate the likely results of the Afghan presidential election 2019. It was carried out to measure the change in public opinion and attitude towards the candidates compared to the pre-election poll. The poll was conducted from 1 to 20 October 2019, with a total of 4,424 adult participants. Of the 4,424 participants in the post-election poll, 48.7% (2,158) said they voted for one of the candidates.

From a majority of 51.3% (2,266) that did not vote, 23.5% stated “security concerns” as their reason not to have voted; 20.9%

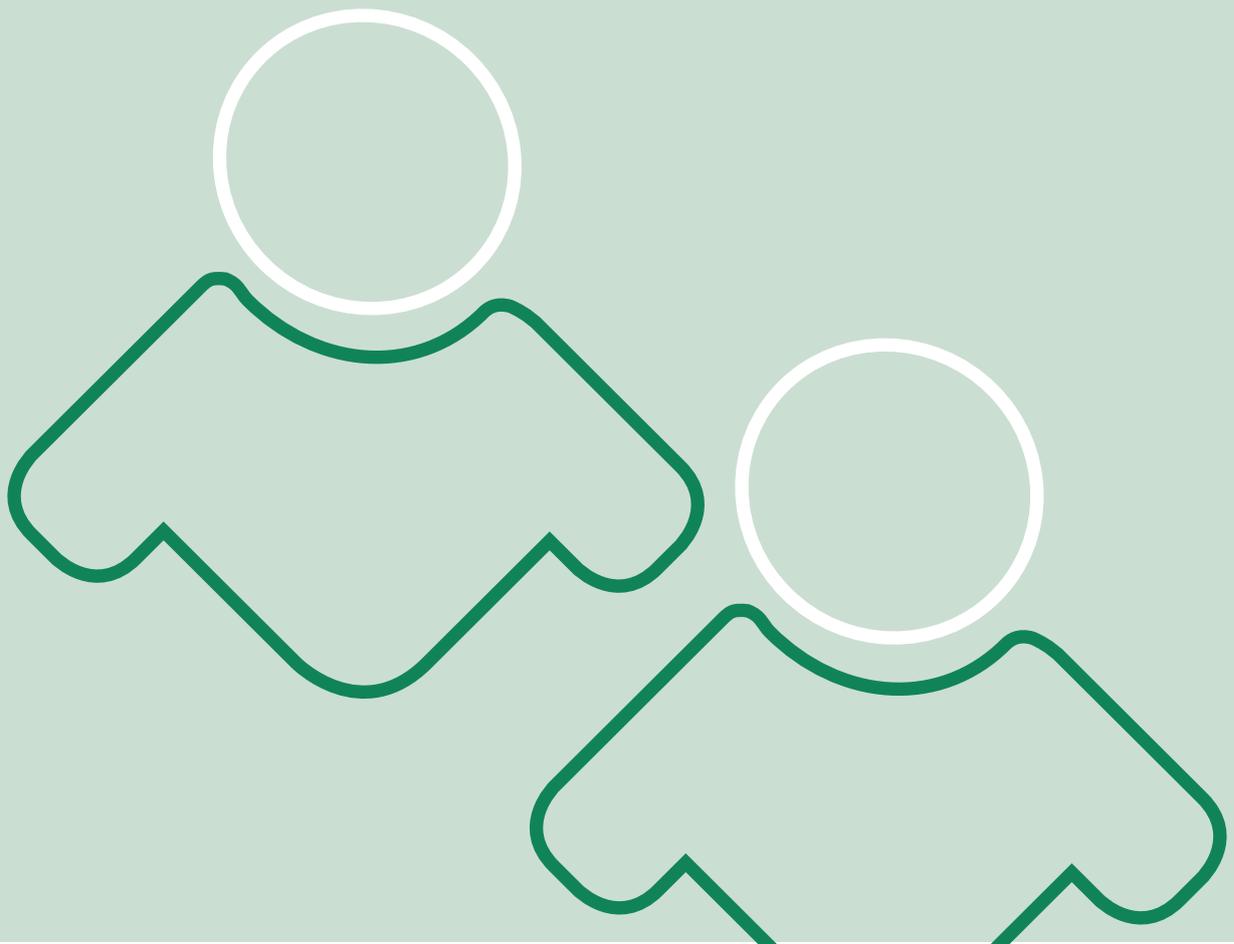

stated “lack of documents”, while 17.2% stated “lack of trust in the election process” for not having cast their vote. A remaining 31% did not give any specific reason.

The male/female ratio was 85:15, which resulted in a disproportionate low representation of possible female voters.⁴ The collected data was broken down and analysed by province, age, gender, occupation, ethnicity, level of education, monthly income, mother language and more, in order to identify possible inclinations pertaining to the candidates.

⁴ The reason for this skewness are manifold: if a household can afford only one mobile phone, it is more likely that the male head of the household will have primary access to that mobile phone and therefore be more likely to be sampled. Furthermore, women are less likely to answer the phone if the caller is unknown. Hence, they are less likely to be sampled.

02

METHODOLOGY

METHODOLOGY

DATA COLLECTION

OSRA polled 4,424 adult participants from all 34 provinces of Afghanistan. The poll interviewed a random and representative sample of men and women aged 18 and over by phone.

Random telephone numbers were generated using SuMSy's intelligent 'valid phone number generator' module. To ensure inclusive and non-discriminatory coverage, numbers from all Afghan telecommunication providers (including but not limited to Roshan, Etisalat, Afghan Wireless, MTN, and Salaam) were used. The data gathering was conducted by experienced operators who contacted participants in order to capture their views. The operators were fluent in all the official languages of Afghanistan including Dari, Pashto, Uzbeki, and Turkmani. Female operators were specifically trained to ease the interview process for female participants, who tendentially feel more comfortable and willing to talk to women.

After gaining the consent of each participant, the interviews were recorded and digitally stored in the SuMSy. The interview questions are provided in Annex II

DATA QUALITY

To ensure consistency and validity of the data, we adopted a two-layer quality assurance check. First, SuMSy has an integrated data validity and consistency check which prevents the entry of invalid and inconsistent data. Second, after the data is entered into the system by the interviewers, it is checked by the data quality control team. They listen to the voice recording and make sure that the entered data is consistent with the recording. After passing these two stages, the data is released to be published on ROPP.

MARGIN OF ERROR

The margin of error in this poll is +/- 3 % resulting from an estimated proportion of $p=0.5$ and a confidence interval of 95%.

DATA PRESENTATION

Real-time Opinion Polling Platform (ROPP) was specially developed and tailored to the context and requirements of this poll. ROPP is a web-based real-time opinion polling, data analysis, and data visualization platform. It offers a very user-friendly and intuitive data analysis and visualization functionality. The user can see the data in different categories and filter it according to demographic attributes; enabling users to infer varying correlations with the help of multiple concurrent filters. This provides and allows for a wide range of hypotheses to be drawn, and possible conclusions to be made.

07

POST-ELECTION PROJECTION

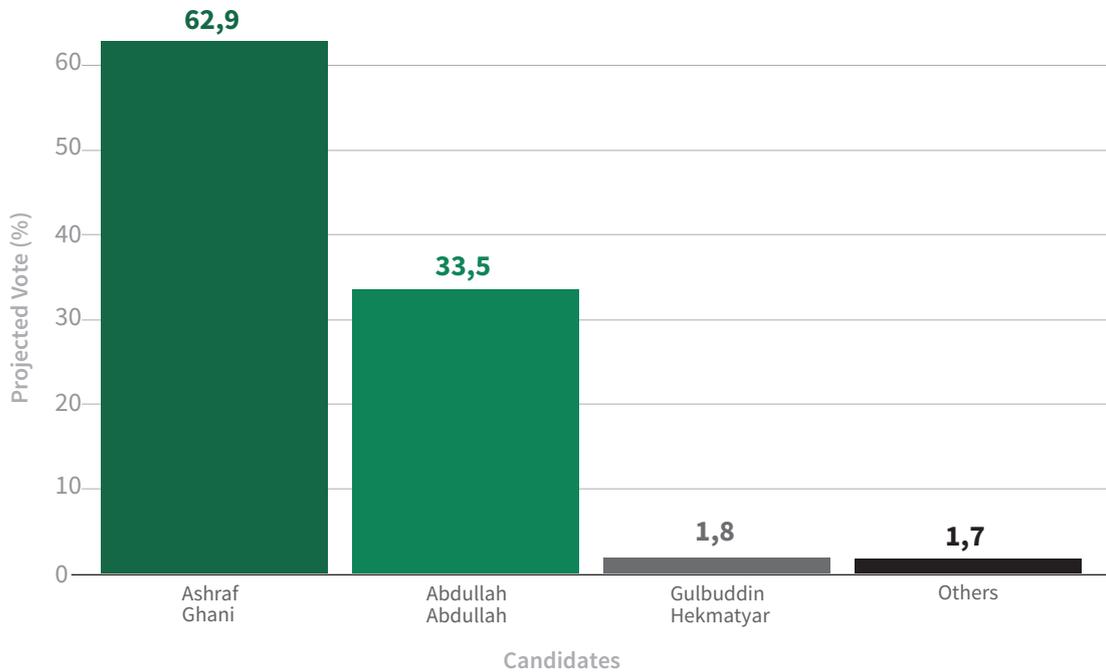

POST-ELECTION PROJECTION

Based on the total number of participants polled after the election, the projection shows the likelihood of what the final results could be. The post-election projection is more reliable, since it is based on actual voting behavior rather than the intention to vote or even to participate. This poll predicts a vote share of approxi-

mately 62.9% for Ashraf Ghani and 33.5% for Abdullah Abdullah. In comparison to the pre-election poll, the result shows a slight decrease of 2.8% percent for Ashraf Ghani from 65.7% to 62.9%. Abdullah Abdullah's voter base shows an increase of 6.9% from 26.6% to 33.5 in the post-election poll.
